Review_PyTorch_Tutorial.ipynb](https://github.com/dr-zool/tcu-ai/blob/main/lab-module/Review_PyTorch_Tutorial.ipynb)

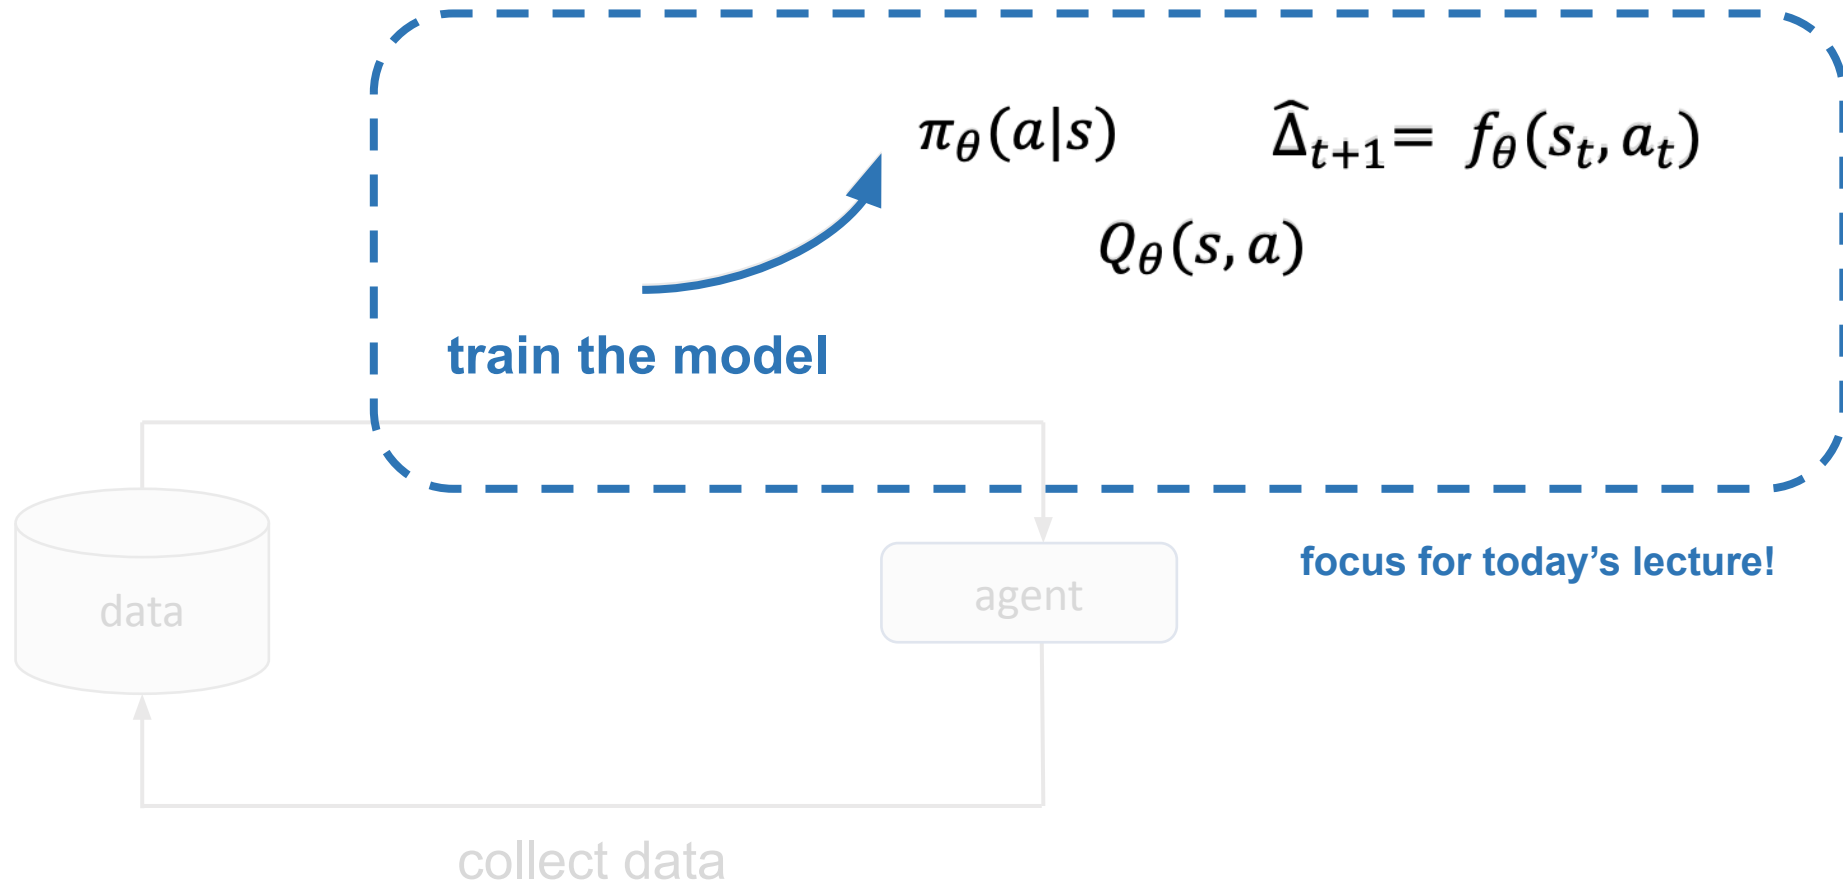

Goal of this course

Train an agent to perform useful tasks

Goal of this course

Train an agent to perform useful tasks

How do train a model?

$$\theta^* = \arg \min_{\theta} \sum_{(x,y) \in D} \mathcal{L}(f_{\theta}(x), y)$$

gradient descent

dataset

loss

neural network

PyTorch does all of these!

What is PyTorch?

Python library for:

- Defining neural networks
- Automating computing gradients
- And more! (datasets, optimizers, GPUs, etc.)

$$\theta^* = \arg \min_{\theta} \sum_{(x,y) \in D} \mathcal{L}(f_{\theta}(x), y)$$

Diagram illustrating the optimization problem:

- $\arg \min_{\theta}$ is associated with **gradient descent**.
- $\sum_{(x,y) \in D}$ is associated with **dataset**.
- \mathcal{L} is associated with **loss**.
- f_{θ} is associated with **neural network**.

How does PyTorch work?

You define:

$$h_1 = \sigma(W_1 x) \quad h_2 = \sigma(W_2 h_1) \quad y = \sigma(W_3 h_2)$$

PyTorch computes:

$$\frac{\partial y}{\partial W_1} = \frac{\partial y}{\partial h_2} \frac{\partial h_2}{\partial h_1} \frac{\partial h_1}{\partial W_1} \quad \frac{\partial y}{\partial W_2} = \frac{\partial y}{\partial h_2} \frac{\partial h_2}{\partial W_2} \quad \frac{\partial y}{\partial W_3}$$

- Fast CPU implementations
- **CPU-only**
- **No autodiff**
- Imperative

- Fast CPU implementations
- **Allows GPU**
- **Supports autodiff**
- Imperative

Other features include:

- Datasets and dataloading
- Common neural network operations
- Built-in optimizers (Adam, SGD, ...)

The Basics

```
arr_a = [1, 3, 4, 5, 9]
arr_b = [9, 5, 7, 2, 5]

# Element-wise operations
list_sum = [a + b for a, b in zip(list_a, list_b)]
list_prod = [a * b for a, b in zip(list_a, list_b)]
list_doubled = [2 * a for a in list_a]

# Indexing
value = list_a[3]
list_slice = list_a[2:3]

arr_idx = [3, 2, 1]
arr_indexed = [arr_a[i] for i in arr_idx]
```

```
import numpy as np

arr_a = np.array([1, 3, 4, 5, 9])
arr_b = np.array([9, 5, 7, 2, 5])

# Element-wise operations
arr_sum = a + b
arr_prod = a * b
arr_doubled = 2 * a

# Indexing
value = arr_a[3]
arr_slice = arr_a[2:3]

arr_idx = np.array([3, 2, 1])
arr_indexed = arr_a[arr_idx]
```

```
import torch

tensor_a = torch.tensor([1, 3, 4, 5, 9])
tensor_b = torch.tensor([9, 5, 7, 2, 5])

# Element-wise operations
tensor_sum = tensor_a + tensor_b
tensor_prod = tensor_a * tensor_b
tensor_doubled = 2 * tensor_a

# Indexing
value = tensor_a[3]
tensor_slice = tensor_a[2:3]

tensor_idx = torch.tensor([3, 2, 1])
tensor_indexed = tensor_a[tensor_idx]
```

100x faster!

Multidimensional Arrays

Multidimensional Indexing

A

Axis 0

Axis 1

32	27	5	54	1
99	4	23	3	57
76	42	34	82	5

`A.shape == (3, 5)`

Multidimensional Indexing

Axis 1

Axis 0

32	27	5	54	1
99	4	23	3	57
76	42	34	82	5

$A[0, 3]$

Multidimensional Indexing

	Axis 1				
Axis 0	32	27	5	54	1
	99	4	23	3	57
	76	42	34	82	5

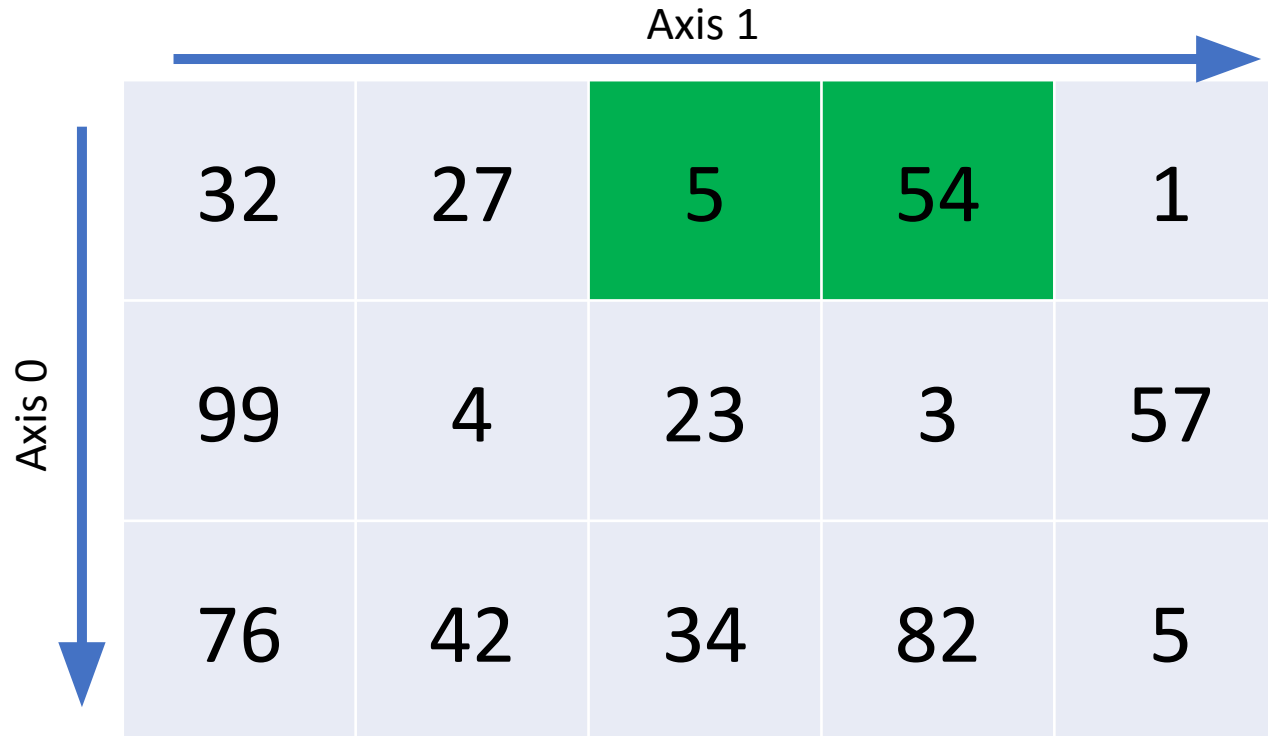

$A[:, 3]$

Multidimensional Indexing

	32	27	5	54	1
	99	4	23	3	57
	76	42	34	82	5

$A[0, :]$

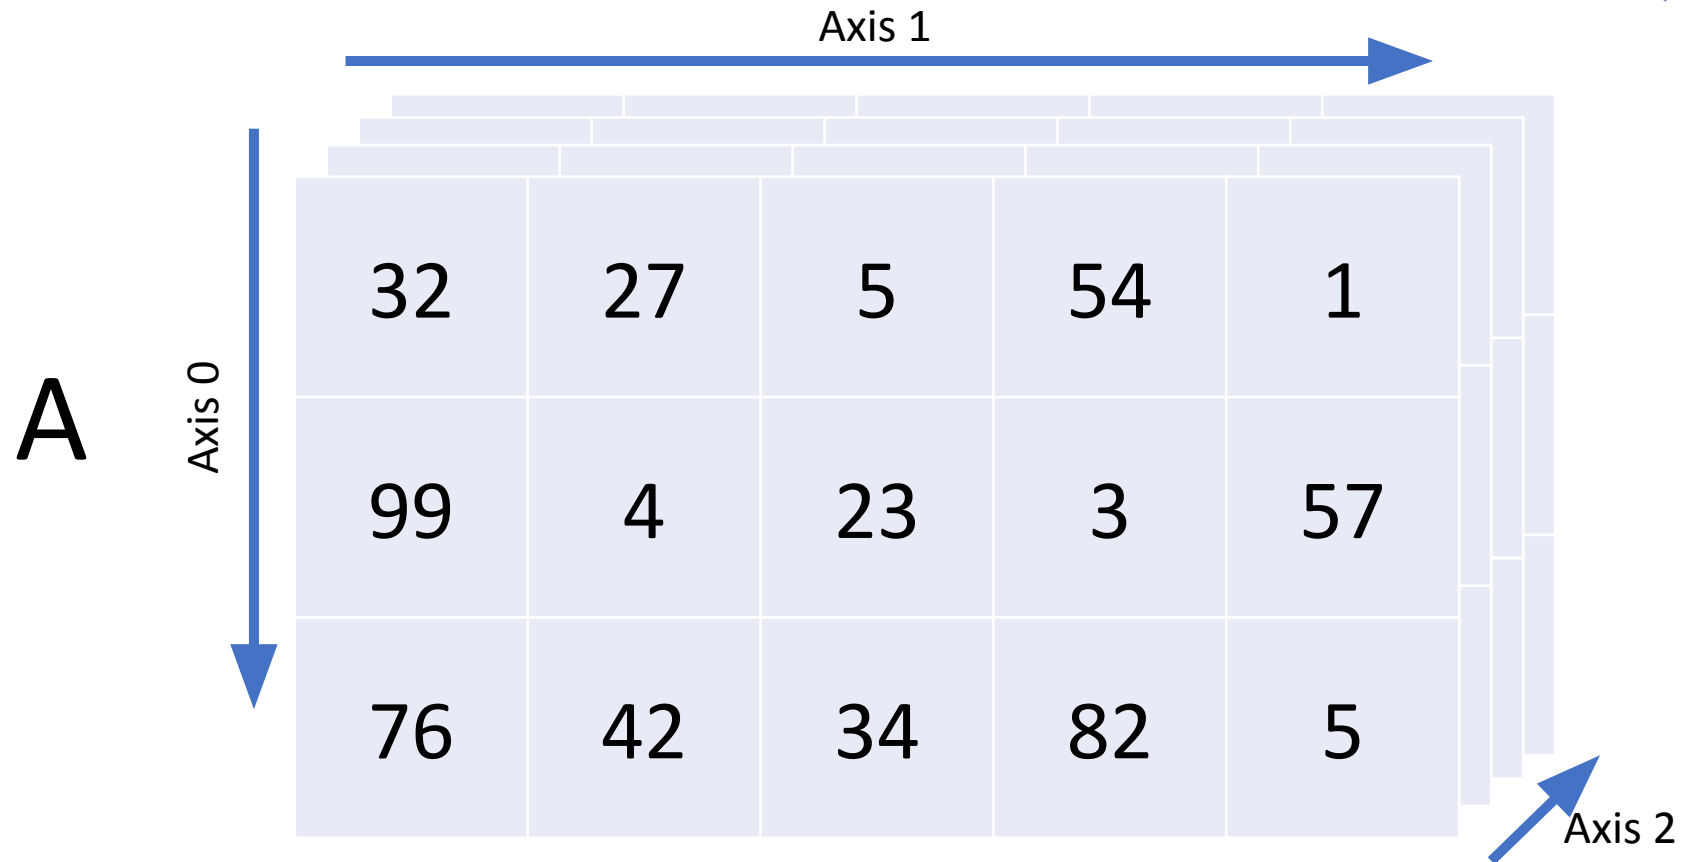

Multidimensional Indexing

		Axis 1 →			
Axis 0 ↓	32	27	5	54	1
	99	4	23	3	57
	76	42	34	82	5

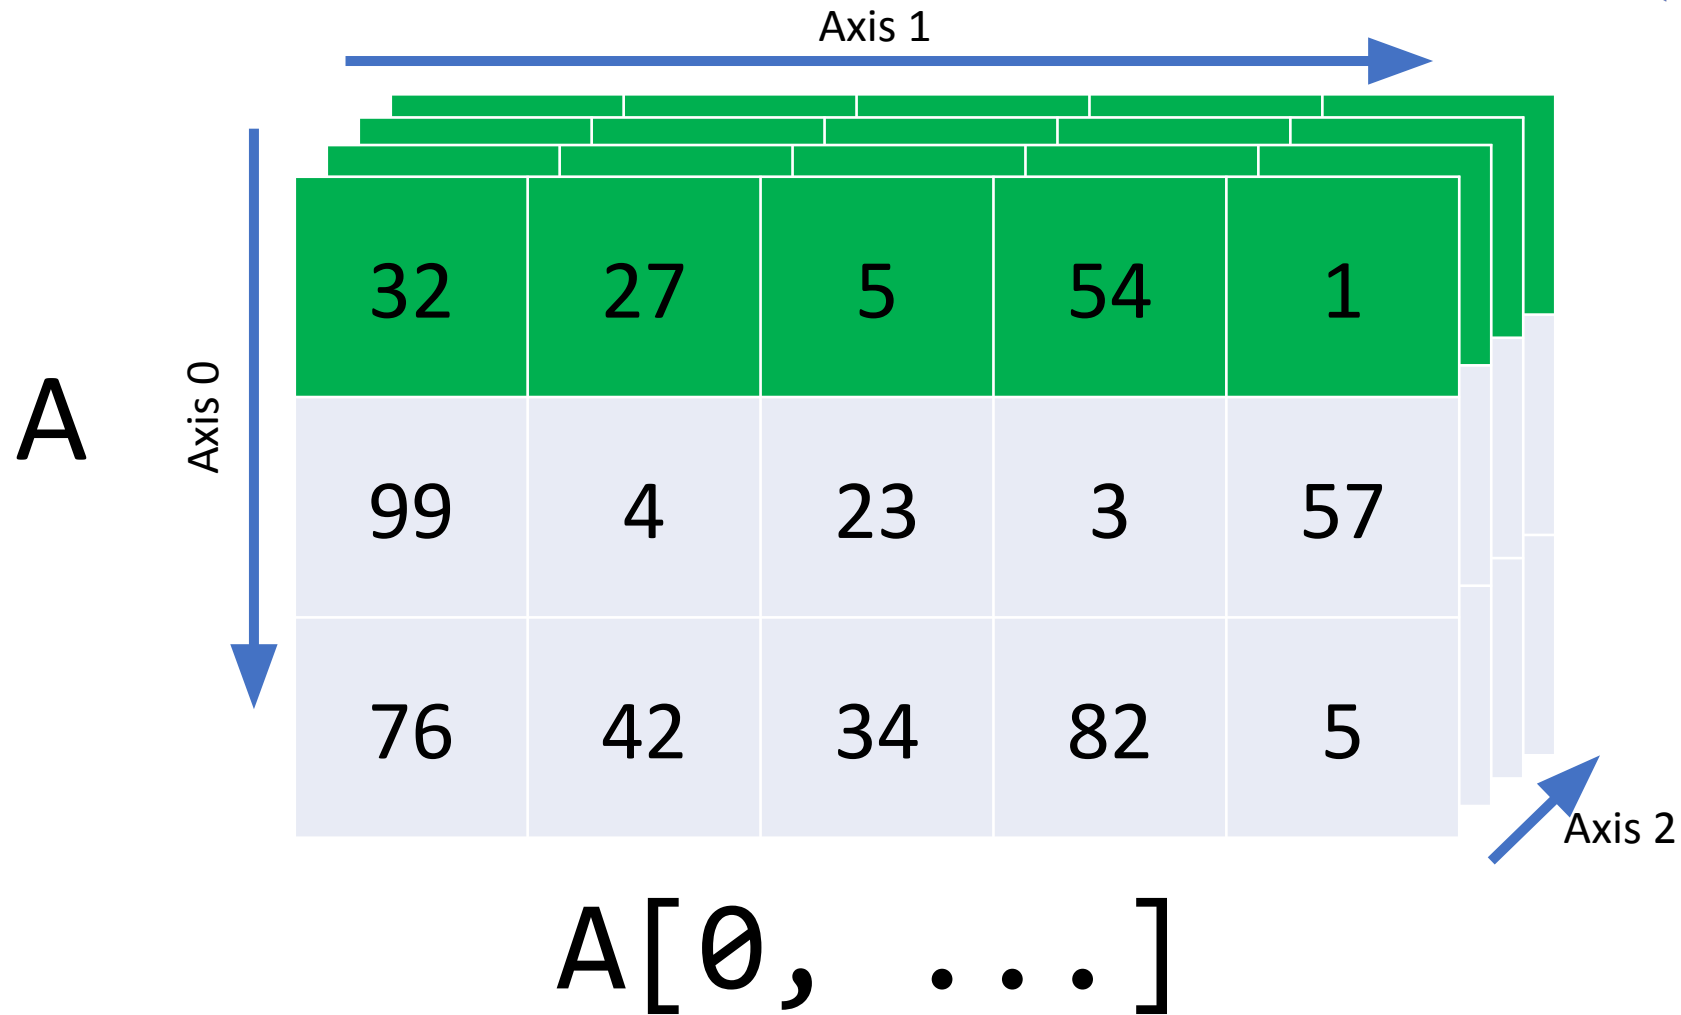

$A[0, 2:4]$

Multidimensional Indexing

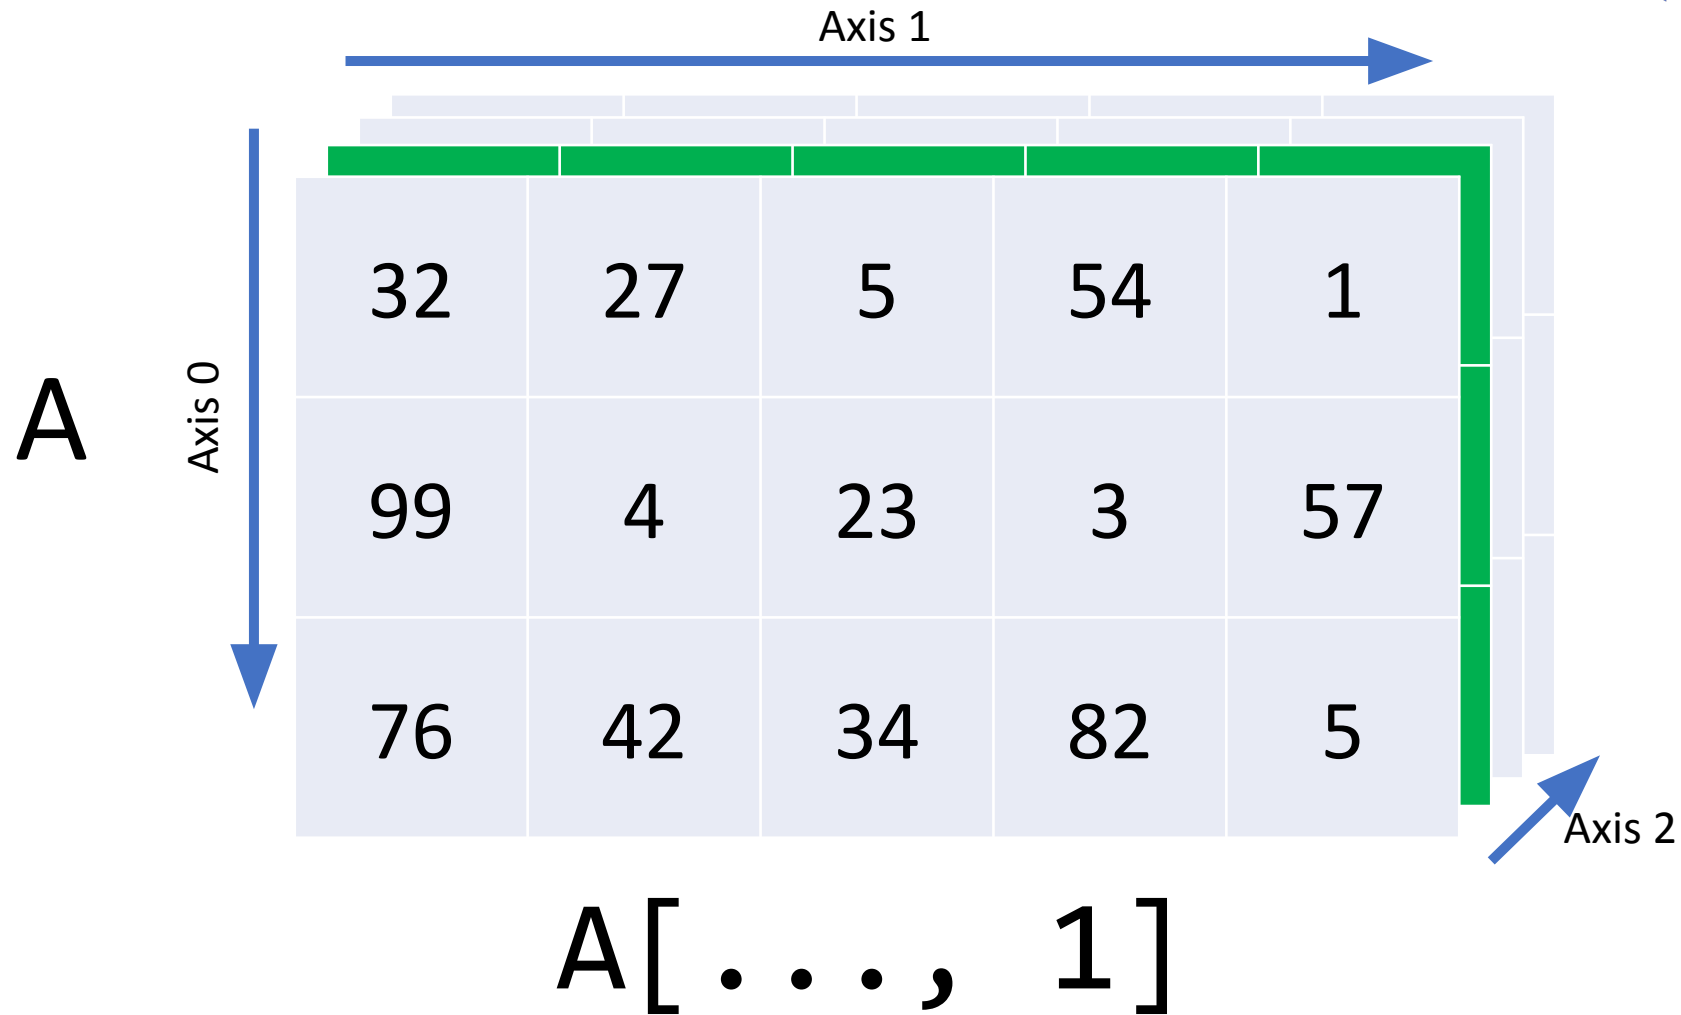

`A.shape == (3, 5, 4)`

Multidimensional Indexing

Multidimensional Indexing

Broadcasting

TL;DR: Shape
like (6, 5, 4, 3, 2)
to shape (6, 5, 4, 3, 2)

(Trailing dimensions
matched, array
repeated along
dimensions)

`np.arange(3)`

Shape Operations

```
A = np.random.normal(size=(10, 15))

# Indexing with newaxis/None
# adds an axis with size 1
A[np.newaxis] # -> shape (1, 10, 15)

# Squeeze removes a axis with size 1
A[np.newaxis].squeeze(0) # -> shape (10, 15)

# Transpose switches out axes.
A.transpose((1, 0)) # -> shape (15, 10)

# !!! BE CAREFUL WITH RESHAPE !!!
A.reshape(15, 10) # -> shape (15, 10)
A.reshape(3, 25, -1) # -> shape (3, 25, 2)
```

```
A = torch.randn((10, 15))

# Indexing with None
# adds an axis with size 1
A[None] # -> shape (1, 10, 15)

# Squeeze removes a axis with size 1
A[None].squeeze(0) # -> shape (10, 15)

# Permute switches out axes.
A.permute((1, 0)) # -> shape (15, 10)

# !!! BE CAREFUL WITH VIEW !!!
A.view(15, 10) # -> shape (15, 10)
A.view(3, 25, -1) # -> shape (3, 25, 2)
```

Device Management

- Numpy: all arrays live on the CPU's RAM
- Torch: tensors can either live on CPU or GPU memory
 - Move to GPU with `.to("cuda")/.cuda()`
 - Move to CPU with `.to("cpu")/.cpu()`

**YOU CANNOT PERFORM OPERATIONS BETWEEN
TENSORS ON DIFFERENT DEVICES!**

```
[ ] device = torch.device("cuda")
x = torch.zeros((2, 3))
y = torch.ones((2, 3), device=device)
z = x + y
```

```
-----
RuntimeError                                Traceback (most recent call last)
```

```
<ipython-input-71-565d7b7035e6> in <module>
```

```
      2 x = torch.zeros((2, 3))
```

```
      3 y = torch.ones((2, 3), device=device)
```

```
----> 4 z = x + y
```

```
RuntimeError: Expected all tensors to be on the same device, but found at least two
devices, cuda:0 and cpu!
```

Computing Gradients

```
P = torch.randn((1024, 1024))
print(P.requires_grad) # -> False
P = torch.randn((1024, 1024), requires_grad=True)
b = torch.randn((1024,), requires_grad=True)
print(P.grad) # -> None
```

Computing Gradients

```
P = torch.randn((1024, 1024))
print(P.requires_grad) # -> False
P = torch.randn((1024, 1024), requires_grad=True)
b = torch.randn((1024,), requires_grad=True)
print(P.grad) # -> None

x = torch.randn((32, 1024))
y = torch.nn.relu(x @ P + b)

target = 3
loss = torch.mean((y - target) ** 2).detach()
```

Training Loop

REMEMBER THIS!

```
net = (...).to("cuda")
dataset = ...
dataloader = ..
optimizer = ...
loss_fn = ..
for epoch in range(num_epochs):
    # Training..
    net.train()
    for data, target in dataloader:
        data = torch.from_numpy(data).float().cuda()
        target = torch.from_numpy(target).float().cuda()

        prediction = net(data)
        loss = loss_fn(prediction, target)

        optimizer.zero_grad()
        loss.backward()
        optimizer.step()

    net.eval()
    # Do evaluation..
```

Converting Numpy / PyTorch

Numpy -> PyTorch:

```
torch.from_numpy(numpy_array).float()
```

PyTorch -> Numpy:

- (If requires_grad) Get a copy without graph with `.detach()`
- (If on GPU) Move to CPU with `.to("cpu")/.cpu()`
- Convert to numpy with `.numpy`

All together:

```
torch_tensor.detach().cpu().numpy()
```

Custom networks

```
import torch.nn as nn

class SingleLayerNetwork(nn.Module):
    def __init__(self, in_dim: int, out_dim: int, hidden_dim: int):
        super().__init__() # <- Don't forget this!
        self.net = nn.Sequential(
            nn.Module(in_dim, hidden_dim),
            nn.ReLU(),
            nn.Module(hidden_dim, out_dim),
        )

    def forward(self, x: torch.Tensor) -> torch.Tensor:
        return self.net(x)

batch_size = 256
my_net = SingleLayerNetwork(2, 32, 1).to("cuda")
output = my_net(torch.randn(size=(batch_size, 2)).cuda())
```

- Prefer `net()` over `net.forward()`
- Everything (network and its inputs) on the same device!!!

Torch Best Practices

- When in doubt, **assert** is your friend

```
assert x.shape == (B, N), \
    f"Expected shape ({B}, {N}) but got {x.shape}"
```

- Be extra careful with **.reshape/.view**
 - If you use it, assert before and after
 - Only use it to collapse/expand a single dim
 - In Torch, prefer **.flatten()/.permute()/.unflatten()**
- If you do some complicated operation, test it!
 - Compare to a pure Python implementation

Torch Best Practices (continued)

- Don't mix numpy and Torch code
 - Understand the boundaries between the two
 - Make sure to cast 64-bit numpy arrays to 32 bits
 - `torch.Tensor` only in `nn.Module`!
- Training loop will always look the same
 - Load batch, compute loss
 - `.zero_grad()`, `.backward()`, `.step()`
